practical 3

3.1.1 problem statement

Write a Python program to create a NumPy array based on user input and display the following:

- The created NumPy array.
- The number of dimensions of the array using `ndim`
- The shape of the array using `shape`
- The total number of elements in the array using `size`

Assume all input elements are valid integers.

Input Format:

- The first line contains two space-separated integers, `r` and `c`, representing the number of rows and the number of columns.
- The next `r` lines contain `c` space-separated integers representing the elements of the array, entered row by row.

Output Format:

- The created NumPy array (printed as a 2D array).
- An integer representing the number of dimensions of the array.
- A tuple representing the shape of the array.
- An integer representing the total number of elements in the array.

Note: Use `reshape()` function to reshape the input array with the specified number of rows and columns.

Code:

```
import numpy as np

r,c = map(int, input().split())

elements = []
for _ in range(r):
    elements.extend(map(int, input().split()))

array = np.array(elements).reshape(r,c)

print(array)
```

```
print(array.ndim)
```

```
print(array.shape)
```

```
print(array.size) Output:
```

Practical Lab Assignment

3.2.1 problem statement The

given code takes two $3 \times$

3matrices, `matrix_a` , and `matrix_b`, as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

1. Addition (`matrix_a + matrix_b`)

2. Subtraction ($\text{matrix_a} - \text{matrix_b}$)
3. Element-wise Multiplication ($\text{matrix_a} * \text{matrix_b}$)
4. Matrix Multiplication ($\text{matrix_a} . \text{matrix_b}$)
5. Transpose of Matrix A Input Format:
 - The user will input 3 rows for , each containing 3 integers separated by spaces.
 - Similarly, the user will input 3 rows for , each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.
5. The Transpose of Matrix A.

Code:

```
import numpy as np
```

```
# Input matrices print("Enter Matrix A:") matrix_a  
= np.array([list(map(int, input().split())) for i in  
range(3)])
```

```
print("Enter Matrix B:") matrix_b =  
np.array([list(map(int, input().split())) for i in  
range(3)])
```

```
# Addition addition_result=matrix_a +  
matrix_b print("Addition (A + B):")  
print(addition_result) # Subtraction  
subtraction_result = matrix_a - matrix_b  
print("Subtraction (A - B):")  
print(subtraction_result) # Multiplication  
(element-wise)
```

```
elementwise_multiplication_result = matrix_a *  
matrix_b print("Element-wise Multiplication (A *  
B):") print(elementwise_multiplication_result) #  
Matrix multiplication (dot product)  
matrix_multiplication_result =np.dot(matrix_a,
```

```
matrix_b)      print("A      dot      B:")  
print(matrix_multiplication_result)  
# Transpose transpose_a =  
matrix_a.T  
print("Transpose  of A:")  
print(transpose_a)
```

3.2.2 problem statement

You are given two arrays arr1 and arr2. You need to perform horizontal and vertical stacking operations on them using NumPy.

- Horizontal Stacking: Stack the two matrices horizontally (side by side).
- Vertical Stacking: Stack the two matrices vertically (one below the other).

Input Format:

- The program should first prompt the user to input two 3x3 arrays.
- Each array consists of 3 rows, and each row contains 3 space-separated integers.
- The user will input the two arrays row by row.

Output Format:

- The program should display the result of the Horizontal Stack (side-by-side stacking) of the two arrays.
- The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

Code:

```
import numpy as np
```

```
# Input matrices print("Enter Array1:") arr1 =  
np.array([list(map(int, input().split())) for i in  
range(3)]) print("Enter Array2:")
```

```
arr2 = np.array([list(map(int, input().split())) for i  
in range(3)])
```

```
# Perform horizontal stacking (hstack)
```

```
a=np.hstack((arr1,arr2))
```

```
print("Horizontal Stack:") print(a)
```

```
# Perform vertical stacking (vstack)
```

```
b=np.vstack((arr1,arr2))
```

```
print("Vertical Stack:") print(b)
```

Output:

3.2.3 problem statement

Write a Python program that takes the following inputs from the user:

- Start value: The starting point of the sequence.
- Stop value: The sequence should end before this value.

- Step value: The increment between each number in the sequence.

The program should then generate a sequence using numpy based on these inputs and print the generated sequence.

Input Format:

- The user will input three integer values: start, stop, and step, each on a new line.

Output Format:

- The program should print the generated sequence based on the input values.

Code:

```
import numpy as np
```

```
# Take user input for the start, stop, and step of the sequence
```

```
start = int(input())
```

```
stop = int(input()) step
```

```
= int(input())
```

```
# Generate the sequence using np.arange()
a=np.arange(start,stop,step) print(a)
# Print the generated sequence
```

3.2.4 problem statement

You are given two arrays A and B. Your task is to complete the function `array_operations`, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.

2. Statistical Operations:

- Calculate the mean, median, and standard deviation of array A.

3. Bitwise Operations:

- Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: $A_i \text{ OR } B_i$).

Input Format:

- The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

Output Format:

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

Code:

```
import numpy as np
```

```
def array_operations(A, B):
```

```
    # Convert A and B to NumPy arrays
```

```
    A = np.array(A)
```

```
    B = np.array(B)    # Arithmetic
```

```
    Operations    sum_result = A + B
```

```
di _result = A - B
```

```
prod_result = A * B
```

```
# Statistical Operations
```

```
mean_A = np.mean(A)
```

```
median_A = np.median(A)
```

```
std_dev_A = np.std(A)
```

```
# Bitwise Operations
```

```
and_result = A & B
```

```
or_result = A | B
```

```
xor_result = A ^ B
```

```
# Output results with one space between each element  
print("Element-wise Sum:", ' '.join(map(str, sum_result)))  
print("Element-wise Difference:", ' '.join(map(str, di_result)))  
print("Element-wise Product:", ' '.join(map(str, prod_result)))
```

```
print(f"Mean of A: {mean_A}")
```

```
print(f"Median of A: {median_A}")
```

```
print(f"Standard Deviation of A: {std_dev_A}")
```

```
print("Bitwise AND:", ' '.join(map(str, and_result)))  
    print("Bitwise OR:", ' '.join(map(str, or_result)))  
    print("Bitwise XOR:", ' '.join(map(str,  
xor_result)))
```

```
A = list(map(int, input().split())) # Elements of array A  
B = list(map(int, input().split())) # Elements of array B  
array_operations(A, B)
```

Output:

3.2.5 problem statement

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to complete the code by:

- Creating a view of the original_array and assigning it to view_array.
- Creating a copy of the original_array and assigning it to copy_array.

After completing these steps, observe how modifying the view affects the `original_array`, while modifying the copy does not.

Input Format:

- A single line of space-separated integers.

Output Format:

- After modifying the view:

Original array after modifying view: `<original_array>`

View array: `<view_array>`

- After modifying the copy:

Original array after modifying copy: `<original_array>`

Copy array: `<copy_array>`

Code:

```
import numpy as np
```

```
inputlist = list(map(int,input().split(" ")))
```

```
# Original array original_array =  
np.array(inputlist)  
  
# Create a view  
view_array = original_array.view()  
  
# Create a copy  
copy_array = original_array.copy()  
  
# Modify the view view_array[0] = 99  
print("Original array after modifying view:",  
original_array)  
print("View array:", view_array) # Modify  
the copy copy_array[1] = 88 print("Original  
array after modifying copy:", original_array)  
print("Copy array:", copy_array)
```

3.2.6 problem statement

The given code in the editor takes a single array, array1, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- search_value: The value to search for in the array.
- count_value: The value to count its occurrences in the array.
- broadcast_value: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

1. Searching: Find the indices where `search_value` appears in `array1` and print these indices.
2. Counting: Count how many times `count_value` appears in `array1` and print the count.
3. Broadcasting: Add `broadcast_value` to each element of `array1` using broadcasting, and print the resulting array.
4. Sorting: Sort `array1` in ascending order and print the sorted array.

Input Format:

1. A single line containing space-separated integers representing `array1`.
2. An integer `search_value` represents the value to search for in the array.
3. An integer `count_value` represents the value to count in the array.
4. An integer `broadcast_value` represents the value to add to each element of the array.

Output Format:

1. The indices where `search_value` occurs in `array1`.

2. The count of occurrences of count_value in array1.
3. The array after adding the broadcast_value to each element.
4. The sorted array.

Code:

```
import numpy as np
```

```
# Input array from the user array1 =  
np.array(list(map(int, input().split())))
```

```
# Searching search_value = int(input("Value to  
search: ")) count_value = int(input("Value to  
count: ")) broadcast_value = int(input("Value to  
add: ")) # Find indices where value matches in  
array1 a=np.where(array1==search_value)[0]
```

```
print(a)
```

```
# Count occurrences in array1  
b=np.count_nonzero(array1==count_value) print(b)
```

```
# Broadcasting addition c=array1 +  
broadcast_value print(c)  
# Sort the first array  
d=np.sort(array1) print(d)
```

3.2.7 problem statement

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- Print all student details: Display the complete details of all students, including roll numbers and marks for all subjects.
- Find total students: Determine the total number of students in the dataset.
- Print all student roll numbers: Extract and print the roll numbers of all students.
- Print Subject 1 marks: Extract and print the marks of all students in Subject 1.
- Find minimum marks in Subject 2: Identify the lowest marks in Subject 2.
- Find maximum marks in Subject 3: Identify the highest marks in Subject 3.
- Print all subject marks: Display the marks of all students for each subject.

Find total marks of students: Compute the total marks for each student across all subjects..

- Find the average marks of each student:
Compute the average marks for each student.
- Find average marks of each subject: Compute the average marks for all students in each subject.
- Find average marks of Subject 1 and Subject 2:
Compute the average marks for Subject 1 and Subject 2.

- Find average marks of Subject 1 and Subject 3: Compute the average marks for Subject 1 and Subject 3.
- Find the roll number of students who scored 24 marks in Subject 2: Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- Find the count of students who got less than 40 marks in Subject 1: Count the number of students who scored less than 40 marks in Subject 1.
- Find the count of students who got more than 90 marks in Subject 2: Count the number of students who scored more than 90 marks in Subject 2.
- Find the count of students who scored ≥ 90 in each subject: Count the number of students who scored 90 or more marks in each subject.
- Find the count of subjects in which each student scored ≥ 90 : Determine how many subjects each student scored 90 or more marks in.
- Print Subject 1 marks in ascending order: Sort and print the marks of students in Subject 1 in ascending order.

- Print students who scored between 50 and 90 in Subject 1: Display students who scored marks between 50 and 90 in Subject 1.
- Find index positions of students who scored 79 in subject 1: Identify the index positions of students who scored exactly 79 marks in subject 1.

Code:

```
import numpy as np

a = np.loadtxt("Sample.csv", delimiter=',',
skiprows=1)

# 1. Print all student details
print("All student Details:\n", a)      #
2. print total students      print("Total
Students:", a.shape[0]) # 3. Print all
student Roll numbers print("All Student
Roll Nos", a[:, 0]) # 4. Print subject 1
marks print("Subject 1 Marks", a[:, 1]) #
5. print minimum marks of Subject 2
print("Min marks in Subject 2",
```

```
np.min(a[:, 2])) # 6. print maximum
